MONTANA VEHICLE CLASSIFICATION COUNT STUDY

INTRODUCTION

This study provides data concerning travel on roads, streets, and highways within the State of Montana. Of most interest are the vehicle-miles traveled by each vehicle type.

DESCRIPTION

On April 1, 1965, Montana began a Vehicle Classification Count Study of all systems of highways, both urban and rural, by utilizing a stratified random sample of locations. A stratum is composed of all the road miles in a given highway system, for a specific shift and season. The sample unit is defined as the road mile-shift day which represents the total traffic by vehicle type during an eight-hour shift on a one-mile segment of highway. A stratified random sample method of determining each road mile-shift day determines an estimate and provides the measure of accuracy within each respective stratum.

Selection of the sample count stations was randomly accomplished from the mile segments of all rural systems and block listings comprising the strata within the municipal areas. The days to be utilized were randomly sampled. Selection was made with reservation as imposed by distance from the previous days count and the change to another weekly shift of different hours of count, particularly the 10 p.m. to 6 a.m. shift.

All count stations sampled were geographically plotted and clustered into groups of five counts which represented one week of counts of the

same shift period. The individual clusters, representing five counts common to the same shift, were randomly sampled by the Table of Random Numbers to complete the sample by season.

The classification count schedule ended March 31, 1966 with 1,204 counts having been taken for all strata. The shifts counted were 6 a.m. to 2 p.m., 2 p.m. to 10 p.m., and 10 p.m. to 6 a.m. The number of counts in each stratum, their distribution by shift and season and the mileage for each stratum are shown in Figure I, page 5.

The seasons were divided as follows:

Spring	April 1, 1965 to May 29, 1965 and February 28, 1966 to March 31, 1966
Summer	May 30, 1965 to August 28, 1965
Fall	August 29, 1965 to November 27, 1965
Winter	November 28, 1965 to February 27, 1966

METHODS OF CALCULATION

Expansion factors for each of the three shifts in the highway strata were calculated according to the formula:

$$\text{Expansion Factor} = \frac{\text{Total miles in stratum} \times 91.25 \text{ days}}{\text{Number of stations in stratum by shift}}$$

However, expansion factors for city streets were calculated by combining seasons and substituting 365 days for 91.25 days because of the low number of counts in these stratum.

The standard error was calculated from the formula:

$$S_j = \sqrt{\frac{N_{hj} - n_{hj}}{N_{hj} (n_{hj} - 1)}} \left[n_{hj} \sum_{j=1}^{n_{hj}} \chi_{hj}^{'2} - \left(\sum_{j=1}^{n_{hj}} \chi_{hj}' \right)^2 \right]$$

Where: S_i^2 = variance for a shift

N_{hi} = number of miles in system x 91.25 (or 365)

n_{hi} = number of stations

X_{hij} = the expanded vehicle miles

h = subscript denoting system

i = subscript denoting shift

j = subscript denoting station

The standard error for combined shifts is given by:

$$S = \sqrt{\sum S_h^2}$$

Expansion factors and standard errors were calculated for separate stratum (except as noted above) to prevent the high mileage, low count stratum from affecting the factors for low mileage, higher count stratum. These results were then combined into the systems shown in Tables I through IV.

RESULTS

Estimates of vehicle-miles of travel by each vehicle type, their standard errors and their relative errors are shown in Tables I through IV. A brief description of each of table is presented below:

Table I shows the data for all systems and shifts listed by season and vehicle type.

Table II has two parts, Rural and Municipal. Each part presents the data by system with all shifts within a season combined. Table II, Municipal, presents data from within a city or town regardless of its population or average daily traffic. .

There are three parts to Table III which covers the Rural, Urban and Municipal systems. Data is presented for each shift counted within each system for each season. The Urban portion is for cities having a population of 5,000 or more and the Municipal is for those having less than 5,000.

Totals for each system and all seasons are listed by shift in Table IV.

An indication of the accuracy of the study may be obtained by comparing the vehicle-miles calculated in this study with those estimated for the 1962 TF-1 Table and the results of the 1963-1964 Motor Vehicle Use Study. This comparison is given below:
